

Indexes Properties

Index Properties

Unique Indexes

- ❑ A unique index causes MongoDB to reject all documents that contain a duplicate value for the indexed field.
- ❑ By default, unique is false on MongoDB indexes.

```
db.collection.ensureIndex({"user_id": 1}, {unique: true})
```

- ❑ Sparse indexes only contain entries for documents that have the indexed field, even if the index field contains a null value.
- ❑ Indexes that need not include every document as an entry.
- ❑ Sparse indexes do not necessarily have to be unique.

```
db.collection_Name.ensureIndex( {"user_id": 1}, {sparse : true })
```

TTL (Time-To-Live) Indexes

- ❑ Allows you to set a timeout for each document. When a document reaches preconfigured age, it will be deleted.
- ❑ Mostly useful for caching problems like session storage.
- ❑ TTL index does not guarantee that expired data will be deleted immediately.

Limitations of TTL Indexes

Limitations

Compound indexes are not supported

Indexed field must be a data type.

Document will expire when the lowest matches the expiration threshold.

Hands-On
