

# The Vecta Corp. Database

## An overview of the Vecta Corp. database structure

- ❖ While the course has presented different examples of database structures, moving forward, the core of the examples will focus in on a fictitious organization known as Vecta Corp.
- ❖ This is a fictitious organization that I have used in my courses for almost 20 years.
- ❖ The database that we will build for Vecta Corp. will focus on its client support needs. Specifically we will build a help desk ticket allocation database that allows customers to submit help desk tickets and, at the same time, allows employees to log in and help customer's with their support problems.
- ❖ The database will consist of 5 tables: employees, roles, tickets, solutions, and status. Let's take a visual look at how these tables interrelate.
